ABSTRACT OF THE DISCLOSURE

METHOD AND SYSTEM FOR
A SECURE BINDING OF A REVOKED X.509 CERTIFICATE TO
5 ITS CORRESPONDING CERTIFICATE REVOCATION LIST

A method, system, apparatus, and computer program
product are presented for enabling an application that is
validating a certificate to have a high level of
10 assurance when checking the membership of a certificate
within a particular certificate revocation list. First,
the application checks whether a certificate's serial
number is found within a certificate revocation list, and
if there is a successful comparison within the serial
15 numbers, then the fingerprint of the certificate is
computed, preferably based on the digest algorithm
specified by the certificate revocation list. The
computed fingerprint is then compared to the
certificate's fingerprint as previously stored within the
20 certificate revocation list. If there is a successful
comparison between the fingerprints, then the certificate
can be properly invalidate or rejected, thereby lessening
the chances that a valid certificate would be improperly
rejected or invalidated.
